

Milestone 1 Guidelines – Fundamental of Computing

1. Introduction

- Provide an overview of your project and the concepts used.
- Clearly state the **aims and objectives** of the project.
- Mention the **technologies used** while completing the coursework.

2. Algorithm

- Write an algorithm for the Python program you developed.
- The algorithm should include **all steps required** to complete the task.

3. Flowchart

- Draw a flowchart based on your algorithm.
- Ensure it clearly represents **all steps of the process**.

4. Data Structures

- Elaborate all data structures such as primitive and collection data types.
- List the **data structures** used (e.g., pairs, lists, strings, dictionaries).
- Describe each data structure with **relevant examples**.

5. Program

- Create a **text file (txt)** containing medicine information.
- The structure and content must follow the **question paper requirements**.
- Write a Python program to:
 - Open and read the contents of the text file.
 - Store the data in a suitable Python collection (e.g., list or dictionary).
 - Display the product/medicine information in the Python shell in a **clear and readable format**.

6. Conclusion

- Short explanation of what you learned.
- Explanation of issues that were faced during the task and how the issues were resolved.
